

Lab 3

Answer question 1 in a file named *StudentID_Firstname_lab3_ans.pdf*, where *StudentID* is your KU ID and *Firstname* is your given name

1. What Would Python Display?

Analyze pieces of Python code below and figure out what would Python display? Then, verify your answer by running the code in Python interactive mode (python3 -i) If you got it wrong, put a short note explaining what you misunderstood.

```
>>> lambda x: x # A lambda expression with one parameter x

_____

>>> a = lambda x: x # Assigning the lambda function to the name a
>>> a(5)

_____

>>> (lambda: 3)() # Using a lambda expression as an operator in a call exp.

_____

>>> b = lambda x: lambda: x # Lambdas can return other lambdas!
>>> c = b(88)
>>> c

_____

>>> c()

_____

>>> d = lambda f: f(4) # They can have functions as arguments as well.
>>> def square(x):
...     return x * x
>>> d(square)

_____

>>> x = None
>>> x
>>> lambda x: x

_____

>>> z = 3
>>> e = lambda x: lambda y: lambda: x + y + z
>>> e(0)(1)()
```

```

>>> f = lambda z: x + z
>>> f(3)

_____
>>> higher_order_lambda = lambda f: lambda x: f(x)
>>> g = lambda x: x * x
>>> higher_order_lambda(2)(g)  # Which argument belongs to which function call?

_____
>>> higher_order_lambda(g)(2)

_____
>>> call_thrice = lambda f: lambda x: f(f(f(x)))
>>> call_thrice(lambda y: y + 1)(0)

_____
>>> print_lambda = lambda z: print(z)  # When is the return expression of a
lambda expression executed?
>>> print_lambda

_____
>>> one_thousand = print_lambda(1000)

_____
>>> one_thousand

_____
>>> def even(f):
...     def odd(x):
...         if x < 0:
...             return f(-x)
...         return f(x)
...     return odd
>>> steven = lambda x: x
>>> stewart = even(steven)
>>> stewart

_____
>>> stewart(61)

_____
>>> stewart(-4)

_____
>>> def cake():
...     print('beets')
...     def pie():

```

```

...     print('sweets')
...     return 'cake'
...     return pie
>>> chocolate = cake()

_____

>>> chocolate

_____

>>> chocolate()

_____

>>> more_chocolate, more_cake = chocolate(), cake

_____

>>> more_chocolate

_____

>>> def snake(x, y):
...     if cake == more_cake:
...         return chocolate
...     else:
...         return x + y
>>> snake(10, 20)

_____

>>> snake(10, 20) ()

_____

>>> cake = 'cake'
>>> snake(10, 20)

_____

```

Do not proceed to the next stage until you fully understand the above code and its behavior. Ask the instructor or the TAs if you are confused about any part of the code.

2. lab3.py

Complete the missing code in lab3.py and make sure that it passes all the test cases. **You must use higher-order functions or lambda expressions to get credit for this problem.**

Submission:

- **Create StudentID_Firstname_lab3 folder, where StudentID is your KU ID and Firstname is your given name**
- **Put the files to submit, StudentID_Firstname_lab3_ans.pdf and lab3.py, into this folder**
- **Zip the folder and submit the zip file to the course's Google Classroom before the due date**
